1. The Premium Group

Combined for better performance

Integrated solutions for mechanical drive technology are our strength. We have formed a group of top businesses which in cooperation with one other, offer economical solutions for your drive technology needs, everything from single products to integrated system solutions.

Your basis for success

High-quality products, application expertise and absolute dependability; your decision for the whole Spectrum of the Premium family is a decision for a strong and reliable partner.

The Premium Stephan Company

Premium Stephan, a member of the Premium group, has been developing and manufacturing a wide choice of gear units, geared motors and other products from the field of mechanical drive technology at the Hameln site for decades. Perfected design, computation and manufacturing technologies have contributed to Premium Stephan's outstanding reputation as a partner for individual drive solutions. Customer-oriented customised gear units or backlash-free precision gears for industrial robots are established components in our product assortment, along with the M4, C4 and E4 series. In our production area of 17,000 m², we manufacture according to the most modern, computer-assisted and especially "streamlined" management principles of the third century. Premium Stephan is an associated partner of the Premium group for mechanical drive technology. Along with planning, development and design, we offer our customers not only individual products, but customised solutions through worldwide distribution. Whether assemblies or closed systems, we have the correct solution for your application.

We possess outstanding references in the development, construction and manufacture of individual drive solutions. Through our worldwide distribution, we also offer package solutions for over-sized gear units and drive elements:

- Standard gear units
- Drive-Packages
- Complete solutions
- Customised gear units
- Low-backlash gear units

2. The M4 Product Family

Features	Strong	Advantages
The optimized gearing and shaft geometry compensates deflection under load. Application-hardened, hard-machined gear wheels correspond to high quality requirements.		The Premium Stephan M4 transfers higher torques with a given shaft-center distance for a long, low-maintenance service life.
Gear unit casings, covers, feet, flanges, and motor casings are heavily ribbed and securely connected to each other.		The ruggedly designed casing ensures maximum robustness under high load and failure-free operation.
Carefully dimensioned shaft and roller bearings absorb high external loads. The components are dimensioned to withstand peak loads even under the most adverse operating conditions.		High load-carrying capacities to absorb high external forces at the input and output shaft ensure a long bearing life of the Premium Stephan M4 geared motor.

Features	Silent	Advantages
Optimized gearing geometry and precise abrasive engineering practice create a smooth rolling of the tooth flanks involved in the engagement.		The result is a nearly perfect tooth engagement, even load distribution across the complete face width, minimum vibrations and, therefore, a smooth, low-noise running.
The inside of the casing was reinforced by ribs Similar to the star-shaped output cover.		Perfectly tied-in ribs dampen vibrations and ensure that vibrations are not passed on to the environment as noise.
Using high-precision machining of the motor flange, motor and gear unit were integrated into a harmonic unit.		The pinion mounted directly on the motor shaft engages in the gearing of the gear unit without angle error and does not create any disturbing noise.

Features	Standard	Advantages
Connection dimensions of shafts, feet, and flanges are identical with those of the market standard.		The Premium Stephan M4 series corresponds to the market standard; based on the outstanding performance Specificities, it is predestined to replace existing drives.
The Premium Stephan M4 program features a broad range of designs and numerous standard options. Additional information can be found in the overview of the product program.		The most economical design for the respective application can be selected and is available worldwide.

Features	Smart	Advantages
The EasyFit System: Pre-assembled gear units are factory assembled in Germany.		Guaranteed High Quality.
Pre-assembled gear units, motors and wheel sets are stoked in the Premium Stephan assembly centers throughout the world.		Over millions of design variants can be quickly assembled through a corresponding combination of pre-assembly components which allows for worldwide availability.
Short assembly time and high part interchangeability are granted at each assembly center side due to the unique EasyFit System.		Short delivery time.

2. The M4 Product Family

The Premium Stephan **M4** preassembly system offers the right components for every application.

The M4 series includes a complete range of coaxial helical geared motors, parallel shaft helical geared motors, and helical bevel geared motors.

The four **S**

Strong,
Silent,
Standard,
Smart

"**S**trong" because of the high rated torques that are above the market standard. They are the most powerful drives on the geared motor market.

"**S**ilent" because of the optimized gearing geometry and precision-finished face flanks that allow for an extremely smooth, low-noise running, and

"**S**tandard" because of market-oriented dimensions that facilitate the conversion to M4 and allow for a Simple assembly for a worldwide geared motor application.

"**S**mart" The unique EasyFit system allows in minutes to assemble a customize geared motor at dealers place (assembly house).

The modular M4 series was built using a minimum of components, thereby ensuring high reliability and Simple maintenance.

2.1 Use as prescribed

Gear units/geared motors are designed for the purpose of converting rotational Speed and torque. They are intended for use in industrial systems and may only be used as recommended in the Premium Stephan technical documentation and in accordance with the Specifications on the nameplate.

3. Product Description

3.1 Quality through innovation and control

The products manufactured by Premium Stephan meet very high quality requirements. Constant control with strict compliance of initiated quality guidelines meets highest demands. State-of-the-art processing centers, contiguous measuring and test technology, and distinctive quality awareness in all employees are a guarantor for efficient and function-oriented products.

Flexible production flows, supported by the Premium Stephan modular system, guarantee high availability while considering individual demands.

The torsionally-rigid gear unit casings are made of high-quality cast iron and guarantee a vibration-free operation. The robust structure of the M4 geared motors is based on ribbed castings and optimum roller bearings to allow for absorbing even high external loads.

A high efficiency is reached through helical, hardened and precision-machined gear wheels. The motor output becomes effective at the output shaft without nearly any losses.

The gear units are tested in the experimental test field and tested for extreme requirements. With standard motor type of enclosure IP 55 and insulation class F, our electric motors are even safe to operate under extreme operating conditions.

Constant innovation and always looking for better manufacturing processes allow for withstanding the growing requirements of the market.

3.2 General technical data

3.2.1 Motor output and output torque

The motor output and torque values listed in the selection tables refer to normal operating conditions and the standard type of construction or to comparable types of construction of the respective type of gear unit. The decisive factor is that the drive stage does not completely run in the oil bath.

3.2.2 Output Speeds

The output speeds listed in the selection tables are guide values and can be calculated using the specified motor speed n_1 (for rated operation) and the respectively valid exact gear ratio i_{ex} . However, the actual output speed depends on the effective motor load and the local supply conditions and, therefore, may deviate slightly.

3.2.3 Service Factor

The Service Factor SF listed in the selection tables is calculated using the maximum permissible torque of the gear unit and the output torque permitted by the installed motor output. Service Factors are not standardized and, therefore, may differ dependent upon the manufacturer. For Premium Stephan M4 geared motors, a gear unit with an application factor of SF = 1 already offers an enduring dimensioning and, therefore, ensures highest reliability. In case of doubt, we would gladly provide you with more information in a personal consultation.

3.2.4 Weights

The weights specified are guide values for further dimensioning. Due to the variation in gear ratios and different types of construction (oil quantity), the exact weights may deviate slightly.

3. Product Description

3.3 General construction design and dimensioning

3.3.1 The gear unit

Gear wheels	Carburized and hardened helical and ground or rotary-beveled Spur gears. Bevel gear wheels with helical gearing, lapped bearing surfaces
Castings	GG-20 cast iron as standard
Adaptors	GG-15 cast iron IEC adaptors
Bearings	Sufficiently dimensioned roller bearings so that input and output shaft can absorb Significant external loads
Shafts	Output shafts made of quenched and tempered steel
Lubrication	Splash lubrication with gear unit oil or grease for designs with oil-feed tubing, the lubrication is carried out via integrated pump. Roller bearing at the output shaft end is lubricated for life with grease.
Seals	Radial shaft seals, with dust lip at the output Side
Efficiency	The efficiency of a gear unit is primarily determined by Splash losses, bearing and gearing friction. On an average across all sizes, the efficiency measures approx. 99 % for standard (or Similar) types of construction for each gear stage.

3.3.2 The Motor

Design	Geared motors with integrated motor up to 45 kW (pinion directly on motor shaft). For universal motor assembly (drive end U), a standard IEC motor of B5 may be attached.
Casting	Aluminum alloy as standard up to size 132. A motor housing of cast iron is available as an option. Cast iron is standard starting with Size 160.
Bearing	Deep-groove ball bearing lubricated for life. Starting at Size 200 with equipment for regreasing.
Type of enclosure	IP 55, higher types of enclosure available upon request. Number of poles: Preferably 4-pole motors (1,500 rpm), other number of poles and pole changing motors are possible.
Voltages	up to 3 kW: 230/400 V ± 10% 50 Hz, 265/460 V ± 10% 60 Hz from 4 kW to 22 kW: 400/690 V ± 10% 50 Hz, 460 V delta ± 10% 60 Hz. Other voltages upon request
Insulation	Insulation class F, utilized to B. Suitable for humidity up to 95%.
Cable entries	On principle, the cable entries of the motors are implemented with the corresponding metric threads. Screwed cable glands are not part of the scope of delivery.
Efficiency class	The standard motors are manufactured according to efficiency class IE 2 . Energy efficient motors to efficiency class IE 3 are available as an option.
Standards	The motors in the range of 0.12 to 22 kW, are according to the standards to CE, CSA and UL. Country Specific executions for USA and Canada are possible on request.

3. Product Description

3.3.3 The brake motor

Design:	Integrated, DC-excited Spring-applied disk brake. Connection via a rectifier installed in the terminal box.
Voltage:	Connection: 230 or 400 VAC corresponding to 102 or 178 V DC at the brake coil.
Type of enclosure:	IP 55 as standard.

3.3.4 Operating conditions

Please consult page 14, chapter 2.5 for hazardous locations according to ATEX.
 The geared motors are suited for use at ambient temperatures from -10 °C to +40 °C and installation altitudes up to 1.000 m.a.s.l.. As delivered with oil filling (see above), ambient temperatures from 0 °C to 40 °C are permitted as standard.
 In case of deviating ambient temperatures and in aggressive environments (acid vapors or Similar), the manufacturer must be consulted first.

3.3.5 Outputs, torques and Speeds

The outputs and torques listed in the tables refer to a condition at operating temperature with permissible ambient temperatures and standard lubricants. The Specified output Speeds are rounded values and refer to the rated Speed of the motor at delivered rated output.

3.3.6 Installation instructions

The geared motor must be installed free of vibrations. Power transmission elements such as belt pulleys or Similar should be arranged as close to the gear unit housing as possible. The cooling air intake of the motor must not be obstructed by unfavorable installation or contamination. The brake must be accessible for maintenance work.

3.3.7 Reference to applicable standards

The gear unit components, such as shafts, pinions, gear wheels, and bearings are dimensioned according to pertinent EN, ISO or DIN standards.

3.3.8 Delivery instructions

Lubricant:	Sizes 1 and 2: Filled with lubricant for life, ventilation not necessary.
Gear unit oil:	Starting with size 3: Gear units for Germany, Switzerland, and Austria are delivered in filled condition (except for SCA, SCP), otherwise unfilled (internally preserved). Before commissioning, the drain plug must be replaced by the supplied vent plug.
Coating:	RAL 5002 top coat as standard.
Terminal box:	Bores are closed with plastic plugs. Screwed glands are not supplied.
Corrosion protection:	Uncoated parts of the drives (e.g. output shafts) are corrosion-protected.
Lifting Lugs:	Starting with gear unit Size 3 and motor Size 112.

3.4 Notes about the operation in hazardous atmosphere (ATEX)

Attention! You cannot select gearboxes and geared motors for application in hazardous locations (ATEX) from this catalogue. Please advise requirements to your nearest Premium Stephan branch. In the framework of harmonizing European laws, the EC Directive 94/9/EG, generally known as ATEX 100a, has been in force since July 2003. Premium Stephan gear units and geared motors implemented as parallel shaft gear units, helical and bevel gear units in ATEX design meet all the requirements of EC Directive 94/9/EG for device category 2 and 3. The drives can be delivered for use in gaseous as well as dust atmosphere.

3. Product Description

3.4.1 Zonal classification

According to Directive 99/92 EG (ATEX 137), the system operator together with the controlling authority determines which zone must be taken into account. The zone definition is carried out according to different criteria, such as operating condition of the system, the period in which an explosive atmosphere may occur, and whether an air-dust or an air-gas mixture occurs.

Probability of occurrence	Air-gas mixture (G) zone	Air-dust mixture (D) zone
Continuous and long-term	0	20
Occasionally during normal operation	1	21
Rarely, without importance during normal operation	2	22

3.4.2 Device safety classified into categories

Electrical and mechanical equipment are classified into three categories according to the safety requirements. Assigning the devices to the categories is determined by the manufacturer based on a detailed danger analysis. The connection between the zones and the device category is Specified in Directive 94/9/EG.

Premium Stephan gear units meet all requirements of category 2 and 3. The design, dimensioning and classification- on into the corresponding category was performed in close collaboration with TÜV NORD CERT. Devices of category 1 are not supplied by Premium Stephan. Devices of category 2 meet all requirements of category 3 and may also be used here.

Category	Type of defect	Prerequisite/use
1 (no drives from Premium Stephan)	Safety in normal operation and also for rare faults (two errors occurring Simultaneously must be handled)	Devices of this category: <ul style="list-style-type: none"> • 1 G in zone 0, 1 and 2 for gas • 1 D in zone 20, 21 and 22 for dust
2	Safety in normal operation and in case of an expected fault	Devices of this category: <ul style="list-style-type: none"> • 2 G in zone 1 and 2 for gas • 2 D in zone 21 and 22 for dust
3	Safety in normal operation	Devices of this category: <ul style="list-style-type: none"> 3G in zone 2 for Gas 3D in zone 22 for dust

Premium Stephan gear units to Directive 94/9/EG for use in air-gas and air-dust mixture.

Premium Stephan has several decades of experience in the design, manufacture and use of drives in hazardous areas. With the introduction of Directive 94/9/EG, the standard series EN 13463 was issued as the basis for explosion protection for mechanical devices.

Premium Stephan M4 gear units in the designs MI, MP and MK meet all requirements of category 2. Requirements for dust protection and gas protection were taken into account for the approval. For this reason, no distinctions are made with respect to categories 2 and 3. Our gear units of category 2 also meet all requirements of category 3.

3.4.3 Type of protection for gear units

Protection through structural safety

EN 13463-5 (identifier "c")

For this type of explosion protection, the protection is ensured through design and construction measures at the devices as well as the experience of the manufacturer.

3. Product Description

Protection through liquid enclosure

EN 13463-8 (identifier "k")

Potential ignition sources inside the gear unit are rendered ineffective through complete or partial immersion in a protective liquid (gear unit oil) or through constant wetting with a liquid film, the protective liquid can be exclusively intended for preventing a potential ignition source to become effective. In devices such as gear units, it also serves the purpose of lubricating and cooling moving parts.

Premium Stephan gear units for category 2G and 2D

Gear units of category 2G can be used in zone 1 and 2 for gases and gear units of category 2D can be used in zone 21 and 22 for dust. For category 2, Premium Stephan issues a certificate of conformity and certifies the following:

- The compliance of the products with standard EN 13463 with the relevant sections.
- The internal manufacturing control according to Directive 94/9/EG Appendix VIII
- Filing the product documentation with the notified body, TÜV NORD CERT

Premium Stephan gear units for category 3G and 3D

Gear units of category 3 can be used in zone 2 for gases and zone 22 for dust. A separate certification for category 3 is not issued. Since all devices for category 2 also meet the requirements of category 3.

Premium Stephan geared motors conforming to Directive 94/9/EG

The experiences collected over decade-long use in hazardous atmosphere also entered into the dimensioning and design according to the new ATEX directives. The following components were taken into account based on this experience:

- Shrink-fit ring covers according to the standard
- All bolts are secured against automatic loosening and protected against rust
- Stainless steel nameplates
- Proven shaft seals at input and output shaft
- High-quality lubricants
- Oil-level control for all Sizes

3.4.4 Type of protection for motors

Motors to Directive 94/9/EG for use with gas

The ATEX motors used by Premium Stephan are manufactured by a well-known German manufacturer. The EN 50014 standard is the basis for the approval. Supplementary standards specify the measures of how an ignition is prevented.

Flameproof enclosure to EN 50018, type of protection "d"

Motors of this type of enclosure can be used for mains operation and inverter operation in zone 1. Motors with flame-proof enclosure can only be combined with the Premium Stephan gear unit in lantern version.

Increased safety to EN 50019, type of protection "e"

The basis of this type of enclosure is avoiding high temperatures at the surface and in the inside during normal operation and in case of a fault, such as a blocked rotor with applied supply voltage. Motors to EN 50019 can be used in zone 1 with mains operation.

Protection through non-sparking equipment to EN 50021, type of protection "n"

The motor design ensures that no gases are ignited during normal operation. A malfunction is not taken into account. Motors to "n" can be used in zone 2 with mains operation.

Motors to Directive 94/9/EG for use with dust

The EN 50281-1 standard serves as the basis for the approval of motors in an explosive dust-gas atmosphere. The decisive factor consists of meeting certain criteria against the intrusion of foreign particles in accordance with EN 60259 IP types of enclosure. Motors of category 3 require at least type of enclosure IP54 and category 2 type of enclosure IP6x.

Dust-proof motors to EN50281-1-1, type of enclosure IP65

Design measures prevent any dust from entering into the inside of the motor. The surface temperature under normal operating conditions does not cause an ignition of dust deposits. A protection in case of faults is ensured through temperature monitoring. These motors correspond to category 2D and can be used in zone 21 and 22 with mains operation.

Dust-protected motors to EN50281-1-1, type of enclosure IP55

In this case, dust cannot enter the motor in dangerous quantities. Only the surface temperature represents an ignition risk and, for this reason, must be protected with temperature sensors. These motors are certified to category 3D and can be used for mains operation in zone 22. For inverter operation, Premium Stephan can perform a corresponding acceptance with the selected inverter.

4. Instructions for Drive Selection

4.1 Service factors / Applications / Operating conditions

4.1.1 Required Service Factor (SF_{min})

Determine the required application factor according to the following formula:

$$SF_{min} = F \times C$$

Whereby the following applies:

F = application factor dependent upon the load characteristic values of the application and the operating time.

The values listed below can be used as guide values for applications that are not listed.

Both criteria - the "Load characteristics related to the application" as well as the "inertia factor M" - must be taken into account. The criterion resulting in the highest F-value is decisive.

Load characteristics of the application	M	F		
		8h/24h	16h/24h	24h/24h
Uniform loads	<0,2	0.8 - 1*	1	1.2
Moderate shock load	<3	1.1	1.25	1.5
Heavy shock load	<10	1.4	1.6	1.7

M = Inertia factor

$$M = \frac{\text{Moment of inertia of driven machine related to motor shaft}}{\text{Mass moments of inertia of the motor (+ brake)}}$$

C = correction factor dependent upon the number of start-ups per hour.

		C		
		8h/24h	16h/24h	24h/24h
	<10	1	1	1
Start-ups / hour	<100	1.1	1.1	1.15
	<500	1.1	1.15	1.25

4.1.2 Selecting the frame Size

A geared motor must be selected for the required motor output (P_m) and the output Speed (n_2) who's Service Factor (SF) is greater than or equal to the required Service Factor (SF_{min}). The selection can also be made based on the available output torque (T_{2m}) of the geared motor.

4. Instructions for Drive Selection

4.1.3 Required application factors for different applications

APPLICATION	Runtime hours/day		
	8h/24h	16h/24h	24h/24h
Construction and building materials machinery			
Mixer	1.25	1.5	1.75
Cement mills	1.5	1.75	2
Mortar guns	0.8 - 1*	1	1.25
Breweries, distilleries			
Mills	0.8 - 1*	1	1.25
Bottling machinery	0.8 - 1*	1	1.25
Elevators			
Bucket elevators	1	1.25	1.5
Load elevators	1	1.25	1.5
Escalators	0.8 - 1*	1	1.25
Filters	1	1.25	1.5
Generators	0.8 - 1*	1	1.25
Wood and plastics processing			
Main drive for saws	1.5	1.75	2
Feed drives for saws	1	1.25	1.5
Crushers	1.5	1.75	2
Machines for gluing, veneering	0.8 - 1*	1	1.25
Drills	0.8 - 1*	1	1.25
Extruders	1.25	1.5	1.75
Machine tools			
Roller straightening, punching device, bending machines	1.25	1.5	1.75
Main and feed drives	1	1.25	1.5
Supply and servo drives	0.8 - 1*	1	1.25
Presses	1.75	2	2
Edging machines	1.5	1.75	2
Plate shears	1.75	2	2
Cranes and hoisting machines	**	**	**
Hoisting gears, traveling drives			
Packaging machines			
Packing machines	1.25	1.5	1.75
Wrapping machines	0.8 - 1*	1	1.25
Compressors			
Centrifugal compressors	1	1.25	1.5
Rotating screw compressors	1	1.25	1.5
Mixers			
Constant density	0.8 - 1*	1	1.25
Variable density	1	1.25	1.5
Iron and steel industry			
Wire-drawing benches	1.25	1.5	1.75
Winding drums	1	1.25	1.5
Roller-table drives	**	**	**

* = 0.8 if operating time < 3h/24h and no external loads occur

** = drives must be dimensioned by the manufacturer

+ = it is recommended consulting the manufacturer for selecting the reverse lock

4. Instructions for Drive Selection

APPLICATION	Runtime hours/day		
	8h/24h	16h/24h	24h/24h
Iron and steel industry			
Non-reversible rolling mills - multi-operation	1.25	1.5	1.75
- single operation	1.5	1.75	2
Mills			
Ball mills, rod mills	1.75	1.75	1.75
Hammer mills, centrifugal mills	1.5	1.75	2
Winding drives			
Pumps			
Rotary pumps	1	1.25	1.5
Circulation, gear, vane pumps	0.8 - 1*	1	1.25
Piston pumps: 1 cylinder	**	**	**

Rakes and channels	0.8 - 1*	1	1.25
Screw pumps	1	1.25	1.5
Screens			
Revolving screens (stones, grit)	1	1.25	1.5
Screens with water circulation	0.8 - 1*	1	1.25
Servo drives for systems			
Service operation	0.8 - 1*	-	-
Setting-up mode, operation without load	1.25	1.25	1.25
Normal operation		Same as main drive	

* = 0.8 if operating time < 3h/24h and no external loads occur

** = drives must be dimensioned by the manufacturer

+ = it is recommended consulting the manufacturer for selecting the reverse lock

4. Instructions for Drive Selection

APPLICATION	8h/24h	Runtime hours/day	
		16h/24h	24h/24h
Agricultural machines Mechanical gutter cleaners Harvesting machines	0.8 - 1* 0.8 - 1*	1 1	* *
Textile machinery Looms Spinning machines Laundry machines	1.25 0.8 - 1* 1	1.5 1 1.25	1.75 1.25 1.5
Print and paper technology Sheeting cutter Winding drives Bale feeder	1 0.8 - 1* 1	1.25 1 1.25	1.5 1.25 1.25

* = 0.8 if operating time < 3h/24h and no external loads occur

** = drives must be dimensioned by the manufacturer

+ = it is recommended consulting the manufacturer for selecting the reverse lock

These Service factors (SF) are empirical values that are based on AGMA and ISO information and experience. They apply to driven machines corresponding to today's state of the art for normal operating conditions and for actuating with electric motors. A consultation is required for Special applications, passenger elevators or Special operating conditions, e.g. high mass acceleration factors.

3.2 External loads, axial / radial, conversion, connections

The permissible radial loads listed in the selection tables are guide values and used only for rough orientation purposes. The data refer to action of load in the middle of the respective solid shaft. If no radial load is present, half the value of the radial load Specified in the selection tables is permitted as axial load. The resulting maximum value of a radial load for each gear unit Size generally occurs at low speeds and is determined by the material and geometry of the shaft. For all lower values of the frame Size, the predetermined bearing life LH10 of the output shaft bearing is limiting. Since variables such as torque, Speed, direction of rotation and load angle of action enter into the calculation and Premium Stephan always assumes the worst-case scenario, Significantly higher external loads are permissible in most cases while giving the effective loads. Please contact us and we will gladly recalculate your Specific case.

3.3 Thermal break even performance

Torque and output stated in the selection charts are mechanical limit values. Depending on mounting position and mounting Situation it is possible that the gearbox will overload thermal before reaching the mechanical breakeven performance. Outputs marked (1) are exceeding the thermal break even performance already under normal application conditions. If the real operation conditions are known, the heat breakeven performance can be recalculated by Premium Stephan. The heat breakeven performance can be increased by using appropriate measures (such as using synthetic lubricants with increased thermal consistency). The following data is necessary for recalculation:

Type or gearbox
 Mounting position
 Input Speed (range) 1/min
 Ratio
 Used output kW
 Duty / power-on time
 Ambient Temperature °C

Installation Site
 in a small, closed room
 large rooms
 outside
 Mounting Situation (Sketch/drawing)

4. Instructions for Drive Selection

Increased Splash losses may occur for mounting positions with high oil level.(MI all V-mountings, MP mounting pos. 2, 5 and 6, MK mounting pos. 2 and 4) or input Speed above 1800 1/min and may lead to excessive heating. Please contact Premium Stephan in these individual cases.

4.2 Notes about the dimensional drawings

The dimensional drawings featured in this catalog are nonbinding. In particular, slightly deviating dimensions may occur for motor dimensions dependent upon the technical requirements. Binding dimensional drawings can be created upon request.

Note:

The user is responsible for providing protective covers and professional setup of the complete equipment.

The flanges on the output Side are manufactured according to DIN 42955-N, whereby the tolerances of the center- ring gears correspond to DIN 42948.

Keyways of the output shafts are manufactured according to DIN 6885-T1-"Form A".

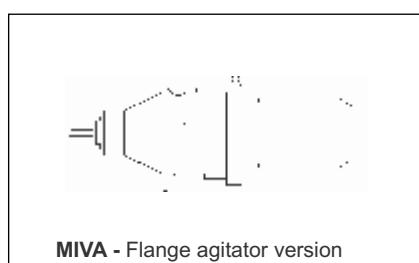

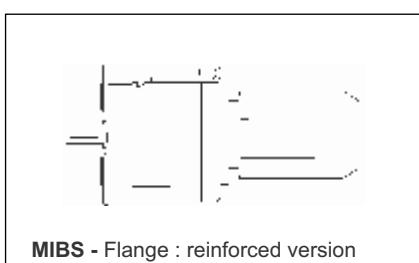

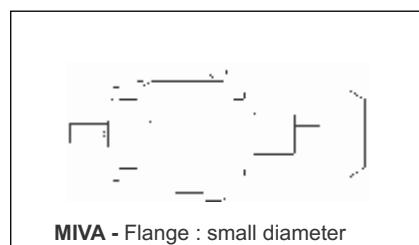

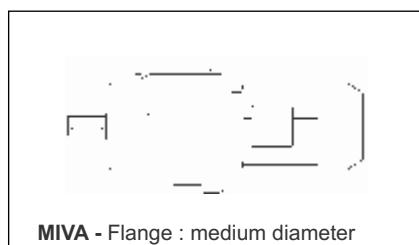

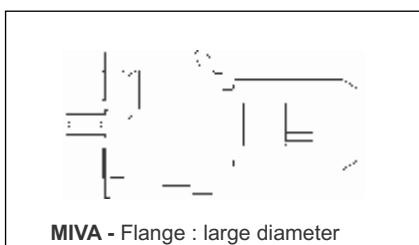

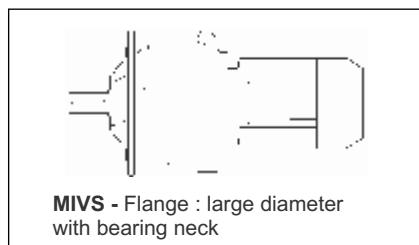

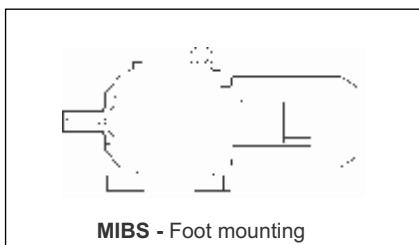

Detailed dimensions of the shafts and recommendations for the designs of the machine shafts can be found in the technical appendix of this catalog.

4.3 Delivery times

Manufacturing and stocking of M4 components are constantly adapted to customer demands. Modern control methods are used in the process. Delivery time for standard design is max. 3 weeks. If necessary we can also achieve 24h delivery - very service. We can also achieve short delivery times for all remaining geared motors. Please contact us and we will gladly assist you.

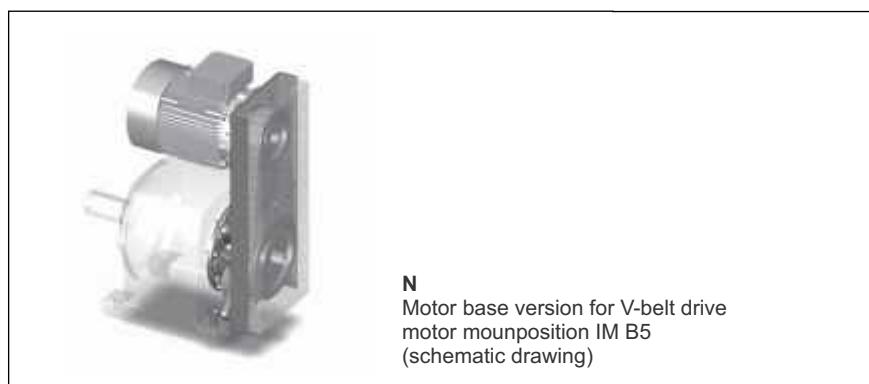

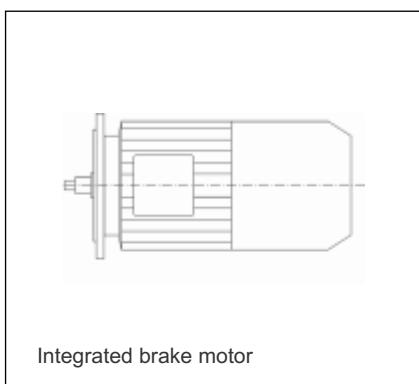

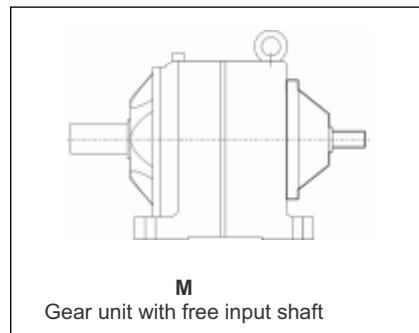

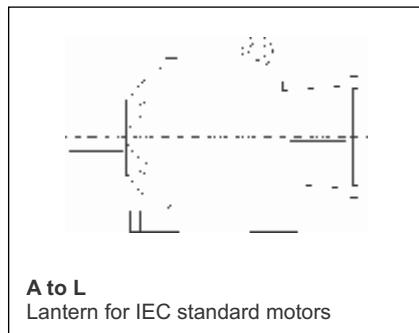

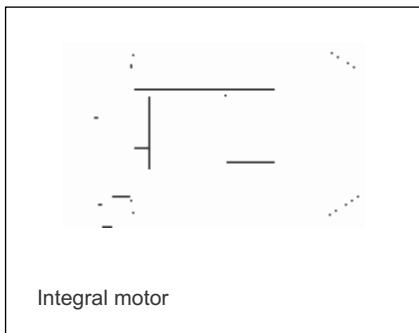

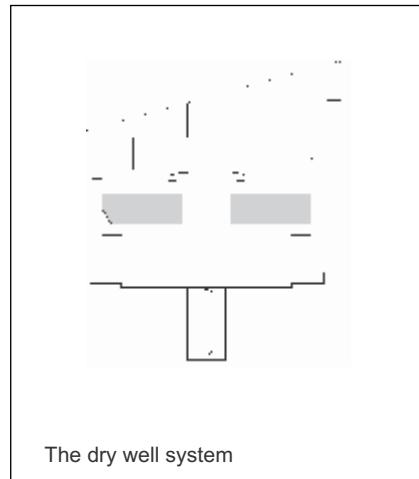

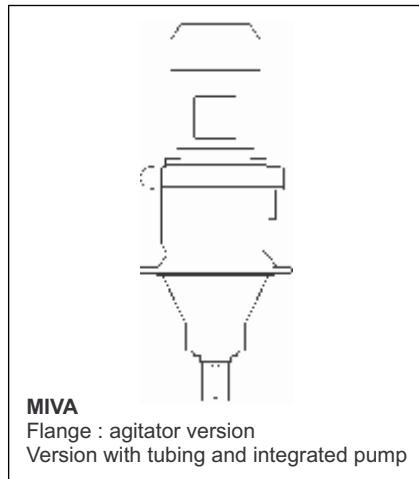

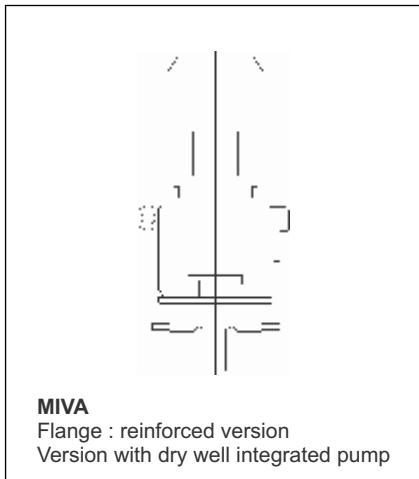

5. MI4 Inline

5.1.1 Version variants for MI4 helical geared motors

5. MI4 Inline

5.1.1 Version variants for MI4 helical geared motors

Overview

	4 Sizes			
	1	2	3	4

6. Technical Appendix

6.1 Technical Appendix, General

6.1.1 Symbols used

Formula sign	Description
C	Correction factor
cos n	Power factor
d	Speed of runner
F	Application factor
F_2	Factor dependent upon stray mass moment of inertia
F_b	Factor dependent upon output and operating time
F_m	Factor dependent upon load torque
F_{rN}	Permissible rated external load
F_{rN-G}	Permissible rated external load for reinforced bearing
F_p	Calculated radial load
f_r	Factor for the radial load
F_r	Calculated radial load (N)
F_x	Axial load
F_x	N Rated axial load
F_z	Dependent upon additional mass moment of inertia
i	Gear ratio
I_A	Starting current
i_{ex}	Exact gear ratio
i_N	Rated gear ratio
I_n	Rated current
J1	Inertia of brake hub and brake disk
J2	Inertia of the motor without brake
J3	Inertia of the motor with brake
JE	Inertia of the motor
J_{zus}	Inertia of the additional mass
M	Mass acceleration factor
m	Mass
M_b	Calculated bending moment
M_{bn}	Rated bending moment
η	Efficiency
n_1	Rated speed of the motor
n_2	Selection of the output speed
n_{2ex}	Exact speed of output shaft (full load)
L_p	Mean sound pressure level at 1 m, without load
n_{max}	Max. permissible speed
n_{syn}	Synchronous speed of the motor
P	Mechanical rated output of the gear unit
P_a	Output power
P_m	Motor output
P_N	Rated switching capacity (motor brake)

6. Technical Appendix

6.1 Technical Appendix, General

6.1.1 Symbols used

Formula sign	Description
P_{zo}	Drive power
r	Pitch circle radius of power transmission element
SF	Available service factor
SF_{min}	Required service factor
S_r	Speed range for motors with inverter
t_b	Brake time
t_1	Operating time of the single-disc safety brake
t_2	Braking time of the single-disc safety brake
T_2	Torque at the output shaft
t_3	Braking time of single-disc safety brakes switching at the AC side
T_A	Starting torque of the motor
T_a	Output torque (load torque)
T_B	Braking torque of the motor
T_K	Breakdown torque of the motor
T_n	Rated torque
T_s	Pull-up torque of the motor
W_{max}	Energy capability per braking
Z	Max. permissible operating frequency of brake motors
Z_B	No. of brakings per hour
Z_{o1}	No-load operating frequency per hour without brake
Z_{o2}	No-load operating frequency per hour with brake

6.2.1 Coating Systems

The standard available coatings for the different types of applications from Premium Stephan are summarized in the following tables. Before the dip primer coating, all castings undergo grit blasting for surface preparation (SA 2 ½). If no special coating is defined, the delivery features system 1 in RAL 5002. For high-quality coatings (4...6), the final color tone can be defined by the customer. If no color tinte is specified, the final coating is done in RAL 5002 (blue).

Deviating versions are possible in addition to the listed coatings (e.g. through customer regulations). However, they must be checked by Premium Stephan for feasibility in each case before placing an order. It is possible that it may result in significant deviations with respect to extra prices and delivery time. Please contact us.

6.2.3 Type of enclosure

The motors correspond to type of enclosure IP55 to IEC 34 - 5 as standard, i.e. they are protected against harmful penetration of dust and water.

The first code number IP5* identifies the protection against harmful dust accumulations inside the motor. The second code IP*5 identifies the protection against the penetration of jet water from all directions. Higher types of enclosure can be supplied upon request.

6.2.4 Insulation class

Proven insulation materials according to class F are used for all motors (limiting temperature 155 °C). However, the actual heating corresponds only to insulation class B (limiting temperature 130 °C). Exception: size 132MG-4G (9 kW).

This ensures high reliability and long service life. It is also possible to operate the motors under special conditions, such as an unfavorable electrical supply, an ambient temperature of 55 °C, or a permanently increased load of up to 110 % of the rated output.

6.2.5 Protection against tropical influences

All motors are designed in type of enclosure IP55 to IEC 34 - 5. They are suitable for use under dusty and humid environmental influences and, to a limited extent, in tropical environments.

If the environmental conditions promote the formation of mildew, algae or condensate, an additional tropical insulation should be provided.

If motors are exposed to humid or condensate-forming conditions for an extended period of time, an electrical space heater (option) is recommended to avoid moisture condensate inside the motor windings. A control device must ensure that the space heater is switched off during operation and switched on during standstill. The standard supply voltage is 230 V ± 10 %.

6.2.6 Protection of motors against non-permissible loads

Selecting the correct protective device largely determines the operational reliability and service life of the motor. Suitable overcurrent release devices (motor protecting switches) are placed in the supply line for direct protection against overload and blocking.

Motors with an output starting at 4 kW are equipped with thermistors (PTC thermistors) as standard. Motors with lower outputs can be supplied with thermistors or thermostats (thermal contacts) upon request (option). Standard motors can be retrofitted with thermostats.

Thermistors (PTC thermistors) are temperature-dependent resistors to IEC 34-11 and DIN 44081 / 44082. Technical data: see below.

Thermostats (thermo switches, thermal contacts) are temperature-dependent bimetal switches. The response temperature is 150 °C and cannot be adjusted. Technical data: see below.

Selecting the correct motor protection is dependent upon the application:

- Possible causes of a thermal overload in each specific application
- Value of product being manufactured
- Costs arising from loss of production
- Possible dangers due to a motor fault

6.2.7 Type of enclosure

Motor fault	Motor protecting switch		Built into the motor windings	
	Thermal	Magnetic	Thermostats	Thermistors
Continuous overload	G	G	G	G
High operating frequency, unsuitable operating mode	A	A	A	G
Continuous undervoltage or overvoltage or incorrect supply frequency	A	A	G	G
High ambient temperature at motor installation site	P	P	G	G
Insufficient ventilation, blockage of air flow	P	P	G	G
Failure of a supply phase	P	P	A	G
Blockage of rotor	G	G	A	G

Key	
G	Good
A	Acceptable
P	Poor or no protection
Thermistor	Response temperature 160 °C, design to IEC34-11 and DIN 44081 / 44082
Thermostat	Response temperature 150 °C, max. 250 VAC, 1.6 A, cos n_0.6

6.2.8 Safe switching of high inductances

- a) Switching of multi-pole motor windings.
Switching a multi-pole motor winding in conjunction with unfavorable conductor routing may lead to voltage peaks that can damage or destroy the winding insulation. It is recommended to equip the supply lines with varistors.
- b) Switching of brake coils.
Varistors must be used to avoid damaging switching over voltages when switching brake coils on the DC side. The brake rectifiers and brake controllers used by Premium-Stephan feature varistors as standard. On principle, special braking contactors or contacts of category AC3 according to IEC158 must be used for switching of brake coils.

6.2.9 50-Hz motors on a 60-Hz supply system

Motors dimensioned for 50 Hz can also be operated on 60-Hz supply networks without any problems. In this case, the rated speed increases by 20%. At the same time, current and power factor remain unchanged. The additional information can be found in the table.

Motor winding 50 Hz	Connection to 60 Hz	Power P	Torque T
400 V ± 10 %	380/400 V ± 5 % 50 Hz	0.90 x P(50 Hz)	0.75 x T(50 Hz)
400 V ± 10 %	400 V -10 % / + 25 %	1.00 x P(50 Hz)	0.83 x T(50 Hz)
400 V ± 10 %	440 V -10 % / + 15 %	1.10 x P(50 Hz)	0.92 x T(50 Hz)
400 V ± 10 %	460 V ± 10 %	1.15 x P(50 Hz)	0.96 x T(50 Hz)
400 V ± 10 %	480 V - 10 % + 5%	1.20 x P(50 Hz)	1.00 x T(50 Hz)
500 V ± 10 %	500 V -10 % / + 25 %	1.00 x P(50 Hz)	0.83 x T(50 Hz)
500 V ± 10 %	575 V ± 10 %	1.15 x P(50 Hz)	0.96 x T(50 Hz)

6.2.10 Operation with inverter

The operation of three-phase AC induction motors with frequency inverter (variable voltage and frequency) causes stray losses in the motor. For this reason, it is generally required to reduce the rated torque of the motors so that the permissible winding temperature is not exceeded. An additional reduction of the output is required due to reduced motor speed and, therefore, reduced self-cooling. The output reduction is dependent upon the torque demand of the driven machine and the speed setting range.

For vertical versions with tubing (SCA, SFA, SCP), the output speed ranges according to chapter 7.4.7 must be taken into account. In case of doubt, a consultation with our plant is required.

High speeds

Standard motors can generally also be operated above their rated speed. If standard motors must be operated with frequencies above 60 Hz, please consult our plant.

Power tables

Rated powers of 4-pole motors from the Premium Stephan series are listed for various applications. Data for other pole numbers are available upon request.

The powers apply to correctly installed frequency inverters with characteristics of column A or B.

	A	B
Complete harmonic distortion	< 2.5%	< 6%
Maximum peak voltage	1600 V	1400 V
Max. voltage rise du / dt	1.0 kV / s	5.6 kV / s
Max. carrier switching frequency	5 kHz	5 kHz
Max. motor to inverter cable length	30 m	60 M

6.2.11 Standard version

Our motors and geared motors correspond to the relevant standards. The most important ones are:

	IEC (CEI)	DIN	VDE
Rated output	IEC 34 - 1, IEC 85	DIN EN 60034 - 1	VDE 0530 - 1
Dimensions	IEC 72	DIN 42673 / 42677	
Mounting position	IEC 34 - 7	DIN EN 60034 - 7	VDE 0530 - 7
Cylindrical shaft ends	IEC 72	DIN 748 - 3	
Terminal designations	IEC 34 - 8	DIN VDE 0530 - 8	VDE 0530 - 8
Enclosure types (IP code)	IEC 34 - 5	DIN VDE 0530 - 5	VDE 0530 - 5
Cooling types (IC code)	IEC 34 - 6	DIN EN 60034 - 6	VDE 0530 - 6
Noise limits	IEC 34 - 9	DIN EN 60034 - 9	VDE 0530 - 9
Supply voltage	IEC 38	DIN IEC 38	

6.2.12 Explosion-protected motors

	IEC (CEI)	DIN
General	IEC 79 - 0	DIN EN 50014
Increased safety (EEx e)	IEC 79 - 7	DIN EN 50019
Flame-proof enclosure (EEx d)	IEC 34 - 1	DIN EN 50018
Non sparking (EEx n)		DIN EN 50021
Electrical equipment for use in areas with combustible dust		DIN EN 50281

6.2.13 Thermal standards

Three-phase AC squirrel-cage motors from Premium-Stephan correspond to the thermal regulations of the relevant national and international standards for permissible over temperature.

Standard	Permissible ambient temperature	Permissible overtemperature in K (measured using the resistance method)	
		Insulation class	
	°C	B	F
DIN, VDE, IEC	40	80	105
British Standards (BS)	40	80	105
Canadian Standards (CSA)	40	80	105
USA (NEMA)	40	80	105
American Bureau of shipping (ABS)	50	75	95

Det Norske Veritas	45	70	90
Germanischer Lloyd (GL)	45	75	95
Lloyds Register (LR)	45	70	90

6.2.14 Tolerances

The following tolerances apply to the performance specifications of electrical machines to DIN EN 60034:

6.2.15 Calculation of maximum permissible operating frequency of motors: Z

The maximum permissible operating frequency of a brake motor is dependent upon:

- the size of the accelerated mass moments of inertia
- the relative operating time
- the relative load, i.e. the ratio of actual output power and
- rated output of the motor
- load torque during acceleration

The no-load operating frequency listed in the tables can be converted to the actual application using the following formula :

$$Z = Z_o \times F_z \times F_b \times F_m$$

F_z Dependent upon additional mass moment of inertia

F_b Dependent upon output and operating time

F_m Dependent upon load torque

Z_o No-load operating frequency at 60% operating time

J_E Mass moment of inertia of the motor

J_{zus} Mass moment of inertia of driven machine referenced to the motor shaft

T_a Load torque

T_A Acceleration torque (motor)

ED Operating time

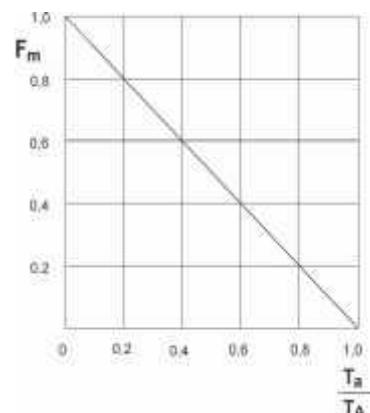

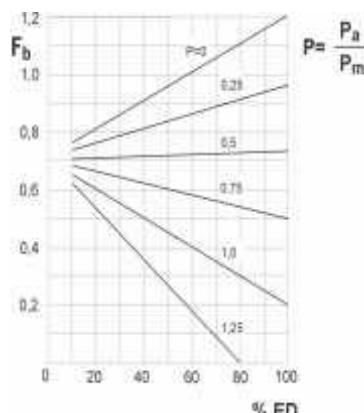

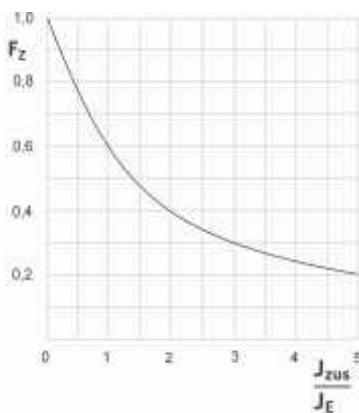

whereby $P = P_a / P_m$

P_a Power demand after completed acceleration

P_m Rated motor output

Technical Appendix

6.2.16 Spring-applied single-disk safety brake for direct current and dry run

In the electromagnetic single-disk brake, the braking force is applied through springs and the brake is electrically released. In case of a power failure, the brake is applied. This allows it to meet the predetermined safety requirements. The brakes can be supplied with a manual release upon request.

The brakes are manufactured and tested according to VDE 0580 and correspond to CENELEC Memorandum no. 3, part 3, par. 2.3 of the EC safety directives.

6.2.16 Spring-applied single-disk safety brake for direct current and dry run

In the electromagnetic single-disk brake, the braking force is applied through springs and the brake is electrically released. In case of a power failure, the brake is applied. This allows it to meet the predetermined safety requirements. The brakes can be supplied with a manual release upon request.

The brakes are manufactured and tested according to VDE 0580 and correspond to CENELEC Memorandum no. 3, part 3, par. 2.3 of the EC safety directives.

Standard voltages:

102 VDC / 230 VAC	for motor output up to 3 kW
178 VDC / 400 VAC	for motor output starting at 4 kW

Other voltages can be supplied and must be specified when ordering.

Technical data:

The response times apply to normal operating temperatures and rated voltage with adjusted gap. The values listed are subject to the regular tolerances.

t_1 (*operating time*) is the time from switching on the voltage to the drop-off of the brake torque to 10% of the rated torque T_B .

t_2 or t_3 (*breaktime*) is the time from switching off the voltage to an increase of the brake torque to 90% of its rated value. t_2 applies to switching on the DC side, t_3 to switching on the AC side.

T29The brakes correspond to enclosure type IP55 and, therefore are protected against damaging dust accumulations and jet water.

P_R is the permissible braking energy in Joule per second. The permissible braking energy per braking W_{Rmax} is dependent upon the operating frequency. The listed values apply to a motor speed of 1500 min⁻¹.

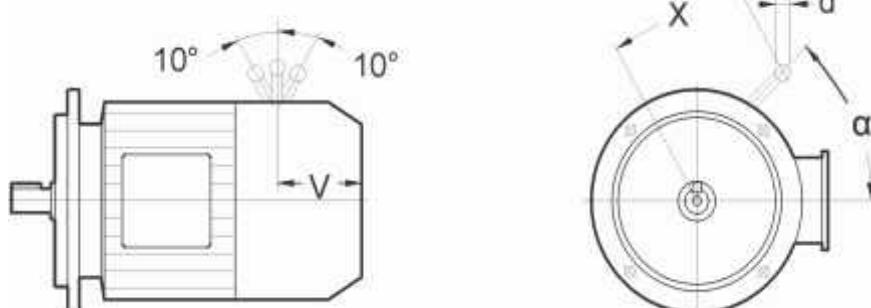

The dynamic braking torque T_B applies to dry run, run in brake and normal operating conditions. The braking torque decreases with increasing motor speed.

If the friction areas contain oil or grease, the braking torque is reduced down to 50%. If the brake is not run in, the braking torque may be 20% less than the rated torque.

6.2.17 Brake kit

Standard motors of size 63 to 180 can be converted to brake motors. *Brake kits* are available for this purpose. The brake hub is installed on the motor shaft to ensure an operationally reliable design. Only the plastic fan blade is driven by a screw-in shaft.

W_{Rmax}	Max. friction energy per operation
W_{RN}	Friction energy until re-adjustment
P_{zo}	Coil power
t₁	Operating time
t₂	Break time (switching on DC side)
t₃	Break time (switching on AC side)
J₁	Moment of inertia of the brake
m	Weight

6.2.19 Power capability per braking

In general, the permissible operating frequency of a brake motor is limited by the heating of the motor. The brake output should be determined for each braking W for control purposes.

$$1W = 0.0055 \times n^2 \times (J_{zus} + JE)$$

The permissible value W_{Rmax} can be found in the diagram.

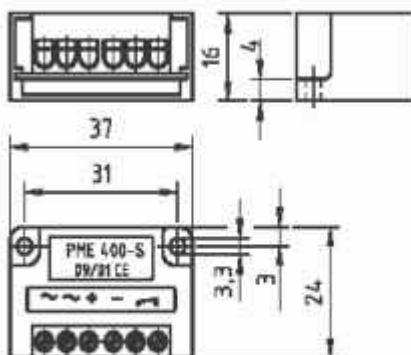

6.2.20 Brake rectifier

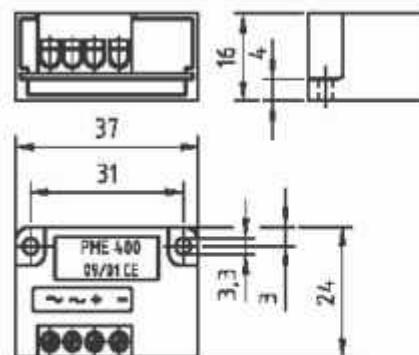

The brake rectifiers being used generate the necessary direct voltage (DC) for operating the brake from the AC supply voltage (AC).

Dependent upon the voltage applied, one-way or bridge rectifiers are used. The brakes are usually switched on the AC side. However, the brakes can also be switched on the DC side for short brake application times. For this purpose, the built-in switching bridge must be removed.

Space heater	70 - 71	H1 - H2
Three-phase AC external fan	U - V - W	
Single-phase external fan	U1 - U2	

6.2.23 2nd shaft end

The motors can be supplied with a second shaft end upon request. Please contact us.

6.2.24 Plug connectors (Harting)

The motors can be supplied with plug connectors upon request. Please contact us.

6.2.25 Cast iron fan

The motors can be supplied with cast iron fan upon request. Please contact us.

6.2.26 Cable entries

Size	Cable entry
63 to 90	1 x M20X1.5
100	1 x M20X1.5
112 to 132	1 x M25X1.5
160 to 180	2 x M32X1.5

Cable entries are closed during transport.
Screwed cable glands are not part of the scope of delivery!

6.3 Technical Appendix, Mechanical

6.3.2 Backstops in the input lantern

Backstops are used to limit the direction of rotation to a freely selectable direction of rotation. In the opposite direction, backstops act as a blocker. Backstops are frequently used for conveyor drives that are operated in a tilt position or for fan drives. In both cases, there is only one free direction of rotation, whereby a spinning of the drive is desired for the opposite direction.

In certain applications, backstops can be an alternative to an electromagnetic brake on the motor.

The backstops are placed at the drive shaft (U/L-lantern) between the regular bearing and are mounted dependent upon the desired free direction of rotation according to the order. The free direction of rotation must be specified at ordering.

If speed-disengaging backstops are used, this safety component needs to be checked only every 6 000 operating hours or no later than every 3 years. The system operator must take all the necessary safety precautions to avoid failure of the backstop that may result in personal injuries and/or damages to the drive unit and/or the application.

It is necessary to replace the backstop under the following conditions:

- In the event of observing unusually high wear of the gear unit.
- When the oil in the gear unit is contaminated.
- In the event of unusually high load.

This may have had an adverse effect on the condition of the clamping elements and bearing races in the integrated backstop.

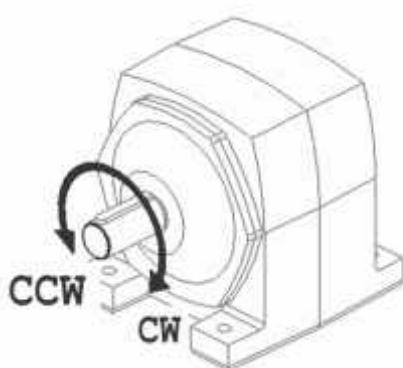

CAUTION!

Only authorized, qualified personnel is permitted to replace the backstop or change the direction of rotation of the backstop while complying with the operating instructions for the respective backstop.

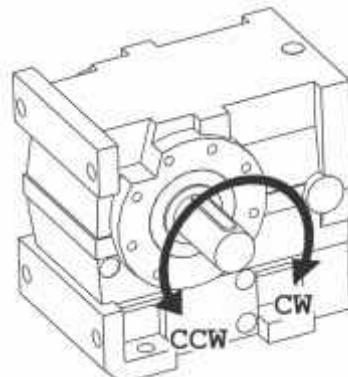

Never loosen or release any part of the backstop facility while the drive is under load: This could affect the reversal action of the drive and load; the drive unit must be in a no-load condition and secured against inadvertent movements.

6.3.3 Indication of output rotating direction when using backstops

For the order of a gearbox with backstop you have to indicate the required direction of rotation, viewed at output shaft on output side of gearbox. For drives with left and right output shaft the direction of rotation is given viewed at side L. To avoid damage to the gearbox or the unit, the direction of rotation needs to be checked before operating.

CW = rotation right, CCW = rotation left

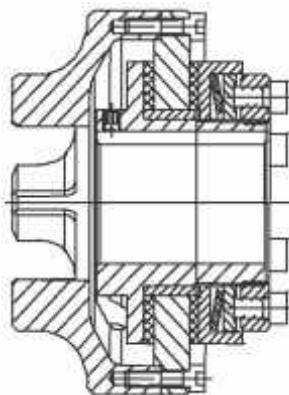

CW = rotation right, CCW = rotation left

6.3.4 Slip coupling in the input lantern

If an input lantern is used, it can be equipped with an additional slip coupling, if necessary, to mechanically limit the torque of the drives. In this case, the slip coupling is installed between motor and gear unit drive shaft. In the normal case, only the standard coupling half of the motor is replaced by the special slip coupling half.

A slip coupling is a component where the permissible torque is transferred frictionally engaged. For this purpose, two spring-loaded friction linings are pressed against each other. The spring force determines the amount of torque that can be transferred. The spring force and, subsequently, the transferable torque can be adjusted.

Slip coupling

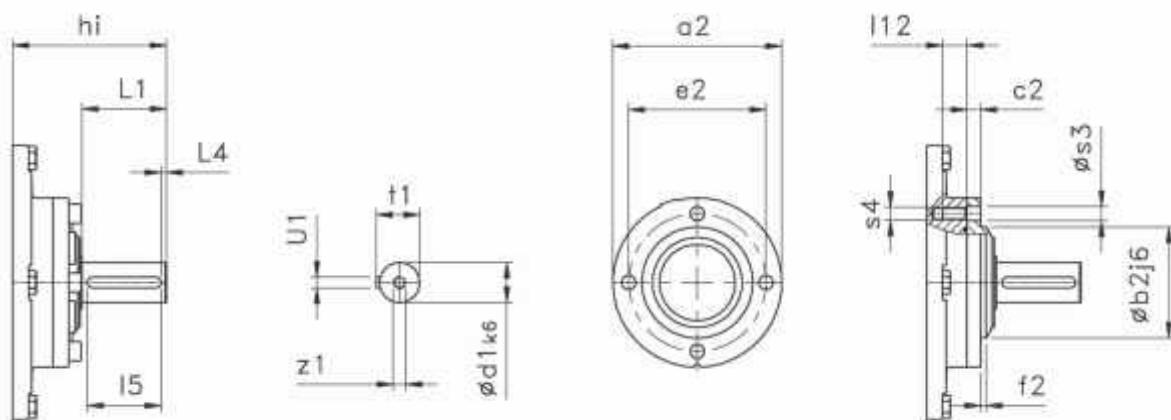

6.3.5 Motor base versions

Our motor base version is a special variant to connect or drive a gear unit with a motor by means of belt drive. This provides the following advantages:

- Compact version - an advantage, for example, if structural conditions do not allow for an integral mounting of the motor.
- After installing the drive in the machine or system, the total gear ratio can be adjusted using a simple change in the belt drive gear ratio.

6.3.6 Gear unit with free drive shaft

All gear units of the S4 family can also be designed with free drive shaft. In this case, there is a standard for the shaft dimensions of the drive shaft dependent upon the gear unit type (MI4) and the gear unit size. This standard is also shown in the dimensioned drawings of the gear units. In addition to these standard dimensions, alternate dimensions are possible or even required, based on applied external loads. The following table provides an overview of the options in the design of the drive shafts. Lines with a light-gray background contain the values for our standard dimensions.

Mounting flange

Gear unit connection	Mounting dimensions								Mounting flange on the drive end

6.3.7 MI4 gear units SCA, SFA and SCP with integrated oil pump

Some types of construction of MI4 gear units offer the possibility of supplying an absolutely oil-proof version for vertical mounting positions (output shaft is down).

For some applications, particularly in chemistry, pharmacy, food processing technology and wastewater treatment and drinking water purification, it is desirable to use absolutely leak-free drives. Since radial shaft seal rings are always wear parts and will eventually leak dependent upon the loads that occur, the regular sealing system may cause danger of oil leakage via the shaft seal.

With our design, the output shaft is safely blocked from the oil supply by means of a tubing. To ensure sufficient lubrication of all relevant components, such as roller bearing and gearing, an additional oil pump (gear pump) is integrated at the intermediate shaft of the gear unit. Using a corresponding inner tubing system, the lubricant is distributed inside the gear unit.

To ensure a sufficient flow rate, the following speed ranges must be taken into account at the output shaft.

Version	B (2 - stage)		C (3 - stage)	
	$n_{2\min}$	$n_{2\max}$	$n_{2\min}$	$n_{2\max}$
	1/min	1/min	1/min	1/min
SCP	30	270	10	80
SCA	30	270	10	80
SFA	30	270	10	80

This version offers an additional advantage on top of the absolute oil-tightness. Due to the low oil level, no gearing moves directly in oil. This results in nearly no splash losses that could lead to a heating of the gear unit. Particularly with low gear ratios, i.e. high output speeds, splash lubrications frequently lead to thermal limits due to occurring splash losses in vertical types of construction. This tubing version allows for largely eliminating the influence of splash losses. This, in turn, allows the drive to be used at relatively high output speeds. Expensive cooling systems can be eliminated.

6.3.8 Noise level

This chapter discusses the noise levels (sound pressure levels) of the S4 gear unit series of size 1 to 9. design index 6 and 7. Motor noises are not taken into account.

Table 1 listed below shows sound pressure level L_p' that can be expected with high probability for standardized conditions. Slight deviations are possible due to manufacturing tolerances.

To obtain values from other conditions, correcting factors must be added according to Tables 2-4.

$$L_p = L_p' + K_1 + K_2 + K_3$$

If the noise level must be guaranteed, 3 dBA must be added at the top tolerance limit. See also the attached examples.

The listed values refer only to the gear units and are intended for an initial orientation. Lower values are partially possible for the noise level. Please contact us.

Sound pressure under standardized conditions:

Table 1 shows values and tolerances for sound pressure L_p' in dBA at a distance of 1 meter from the gear unit (Input speed $n_1 = 1500$ 1/min gear ratio $i = 11.2$). The reference power is dependent upon the service factor SF.

Table -1

Gear unit size	Consumed power in kW							
	Half the catalog power data, $\frac{1}{2} P$ in kW							
	1 kW	2 kW	5 kW	10 kW	20 kW	50 kW	75 kW	100 kW

Examples

Example 1 SFN46C25-132M-4G, consumed power P_a = 7.5 kW
 Expected sound pressure level at 1 meter?
 Service factor SF=1.2 ' use consumed power according to Table 1 (interpolate and round the values)
 $L_p' = (67.8 +/- 1.5) \text{ dBA}$
 Distance = 1 m, n₁ = 1500 1/min i = 11.2 ' K₁=K₂=K₃ = 0
 $L_p = L_p'$
 Guaranteed value = (67.8 + 1.5 + 3) dBA = 72.3 dBA

Example 2 SCF56B8-160M-4G, consumed power P_a = 11kW
 Expected sound pressure level at 1 meter?
 Service factor SF = 3.45 ' Use half the catalog power data (see Gear unit selection tables)
 $P/2 = (39/2) \text{ kW} = 19.5 \text{ kW} \rightarrow L_p' = (72 +/- 2) \text{ dBA}$
 Distance = 1 m, n₁ = 1500 1/min, i < 11.2 ' K₁ = K₂ = 0, K₃ = 2 dBA
 $L_p = (L_p' + 2) \text{ dBA} = (74 +/- 2) \text{ dBA}$
 Guaranteed value = (74 + 2 + 3) dBA = 79 dB

6.3.9 Mass moments of inertia J (10^{-3} kgm 2)

The listed values each refer to the drive shaft of the gear unit.

MI4

2/3-stage gear units J (10^{-3} kgm 2)

7. Technical Appendix

6.3.10 External loads at the output shaft

Calculation

Occurring radial load

The radial load exerted through a power transmission element is derived from the following formula:

$$F_r = \frac{9550 \times P_a \times f_r}{n_2 \times r} \quad \text{or} \quad F_r = \frac{T_a \times f_r}{r}$$

whereby

- F_r = calculated radial load (N)
- T_a = output torque (Nm)
- n_2 = output speed (min⁻¹)
- r = pitch circle radius of power transmission element (m)
- f_r = factor for the radial load
 - = 1 for a sprocket (single string)
 - = 1.25 for a gear wheel or sprocket (double string)
 - = 1.5 for a V-belt pulley
 - = 2.5 for a flat belt pulley

7. Technical Appendix

Point of action of the radial load

The distance of the point of action to the shaft shoulder must be as small as possible.

The following tables provide the permissible rated external loads (F_{rN}) at four different points of action. For other points of action, the values can be determined through interpolation.

Check:

whereby

Check whether

$F_{rN} = F_r \times SF_{min}$

SF_{min} = required Service Factor

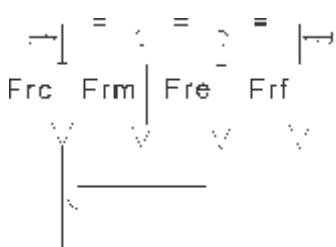

F_{rN} = permissible rated external load

Permissible rated external loads F_{rN}^* (N) at the output shaft for multi-stage gear units (entire S4 family).

6.3.11 Installation, General Conditions

The drive units must be installed or attached free of vibration or mounted on a flat, rigid and solid frame or foundation in order to avoid vibrations.

CAUTION!

The drive units must be aligned with utmost care! Stress and strain in the housing must be avoided.

To align the gear unit, place it on 3 of the 4 mounting points and use shims to match the fourth point to an accuracy of less than 0.2 mm.

After the gear unit has been aligned correctly and after the shims have been fitted, the gear unit must be firmly screwed down to the foundation. Screw class 8.8 in accordance with DIN 267. Screw size: see dimensional drawings. The screws must be tightened to the torque requirements as specified by the manufacturer. Trouble-free lubrication and ventilation are ensured only when the gear unit is mounted in the correct position.

It is necessary to correct the amount of lubricant and the position of the breather screw if the mounting position of the gear unit is changed.

Before start-up, check the position-dependent oil level by loosening the oil level plug of the drive unit.

CAUTION!

Sizes 1 and 2 are lubricated for life. In this case, the surface temperature and the noise level emitted by the gear unit must be constantly monitored during the procedure.

Intermediate inserts or pads made of plastic must be used if there is a risk of electrochemical corrosion between the gear unit and system. Gear unit casings must be grounded.

The cooling air intake of the motor must not be obstructed.

6.3.12 Mounting power transmission elements

Observe the operating instructions provided with the power transmission elements. Use elastic couplings for direct power transmission from gear unit to driven machine, while slip couplings are required in case of a blocking risk. Only use rigid couplings in connection with unsupported or overhanging shafts (e.g. with agitators or aerators).

Due to the radial loads that occur, power transmission elements such as flat belts or V-belts, gearwheels and sprockets, cranks, eccentric cams etc. are to be arranged as close to the gear unit housing as possible. Consequently, the bearings and drive shaft are then subject to the lowest load. Refer to the technical sales documentation for the maximum permissible load values.

The protective coating on the end of the shaft must be removed by suitable means prior to mounting the transmission elements. The same procedure applies for transmitting the drive power to the gear unit in connection with a free drive shaft. Great care must be taken while fitting power transmission elements onto the ground output shaft of the gear unit, and can be carried out using the threaded hole provided for this purpose on the end face of the shaft. Preferably, the power transmission element should be heated to a temperature of approx. 100 C°. The hole is to be dimensioned in accordance with ISO H7. All parts must be thoroughly deburred, cleaned and the fit locations lightly greased. Avoid all knocks and impact to the end of the shaft.

6.3.13 Mounting coupling on output shaft

Observe the operating instructions from the coupling manufacturer.

Accurate alignment and regular inspection are necessary.

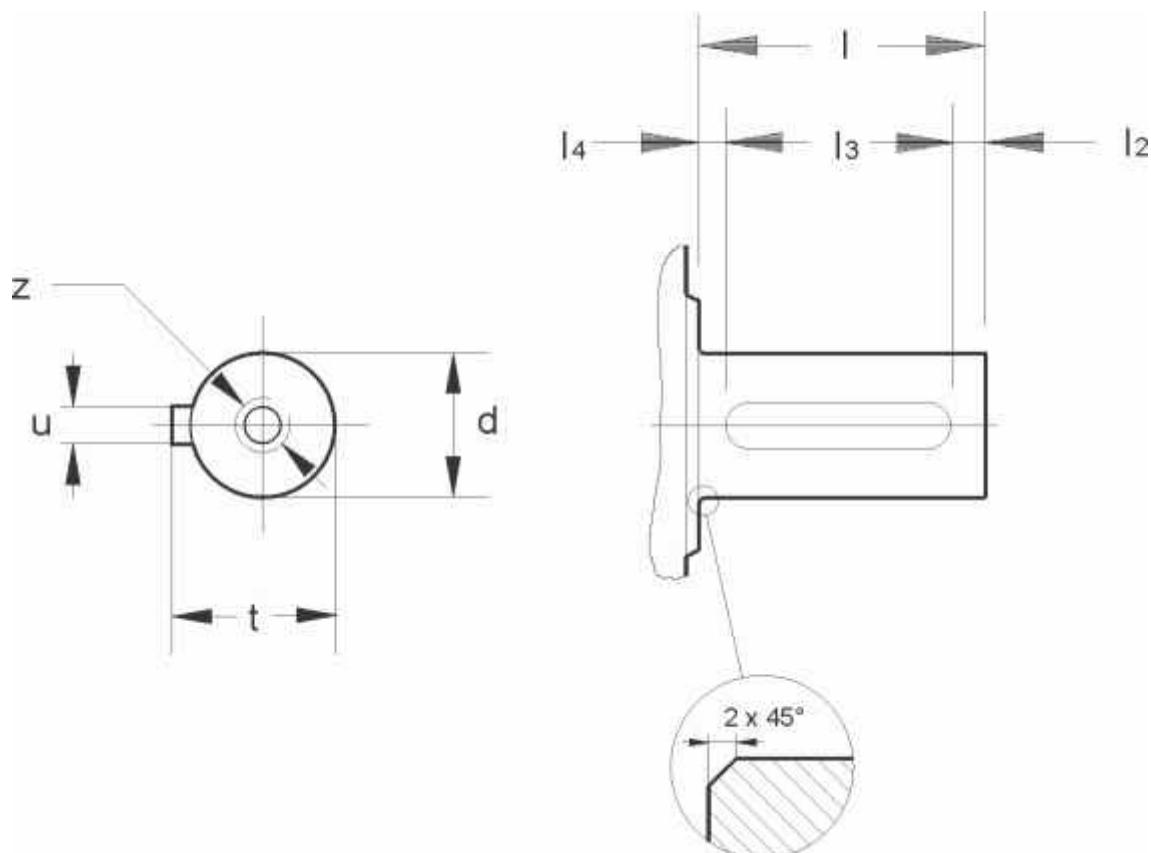

The maximum permissible shaft extensions of the coupling used must be maintained and checked.

The specified distance between the coupling halves should be maintained.

Only adjust the radial offset after the angle offset and the distance between the shaft ends have been checked. Recheck the angle offset after correcting the radial offset.

6.3.14 Mounting gear units with solid shaft
